

Our idea born from the belief that to optimize any system it is necessary to have a lot of data knowledge. Starting from a concept already applied in the energy sector, it is proposed to create a site in which the map of all the buildings of the city is loaded. All the population through a site registration and the installation of a smart-metering meter in their building can load the data of their building in order to make it participate in the fight against the waste of water consumption.

The motivation that will make the citizens definitely participate in the project will be to have a reduced tariff on water consumption.

The mapping will be very important because through it you can discover all the criticalities of the water system and apply new solutions to eliminate them.

We are convinced that through collective involvement and through careful analysis we could improve and greatly reduce water consumption.

Sustainable growth is a moral duty we have towards our children.

Given the variety of the population of Jerusalem we will create a portal that will unite all the inhabitants regardless of religion or social background, all united to improve the city.
